WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatism (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). Bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties, all other cases are classified as "disease."

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all

diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant."

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

Because troops in transit and certain small detachments are not required to submit Reports, as well as for other reasons, the total strength of the reporting units as shown on this report has been consistently about four percent under the actual strength of the Army in the Continental United States.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 9 JUNE 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As shown in the chart on page 3, the admission rates from all causes, from all diseases combined, and from injury decreased fractionally for the week ending 9 June 1944. For the current week, the admission rate from all causes was reported at 550 per thousand and the admission rate from disease at 481 per thousand or about 1 percent lower than the rates registered the previous week. The current week's admission rates are not only the lowest recorded in 1944 but also under the lowest rates reported during 1942 and 1943. As compared with the corresponding week of 1943 current morbidity is about 28 percent lower.

Morbidity from injury was reported at 69 per thousand or at about the same level as has prevailed in 1944 to date.

Respiratory Causes:

The admission rate from colds, influenza, etc. decreased for the sixteenth consecutive week being currently reported at 82 per thousand or only 2 percent below the rate for the preceding week and more than 50 percent under the rate for the corresponding week for 1943. The current week's admission rate from these causes is not only the lowest reported for 1944 to date but also below the lowest rates registered during 1942 and 1943.

The admission rate from pneumonia remained at 9 per thousand the lowest rate recorded so far this year and about 35 percent below the rate for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) remained at 29 per thousand, which is the average rate experienced during the first five months of 1944. The admission rate for diarrhea and dysentery was reported at 12 per thousand, the highest so far this year; since the end of March when morbidity from this cause was at a level of about 6 per thousand there has been a steady increase in the admission rate from these causes. The number of new cases of measles, mumps, and scarlet fever all declined appreciably. The number of new cases of measles and scarlet fever were by far the lowest recorded for any week this year. The number of new cases of mumps, however, remained relatively high. The number of new cases of meningitis and rheumatic fever remained at about the same level as during the previous week.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

All Service Commands except the Eighth and Ninth showed decreases in morbidity from all causes, but in most instances these changes were of relatively small magnitude. The Military District of Washington experienced the highest admission rates from all causes (646 per thousand) and from disease (599 per thousand) while the First

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 9 JUNE 1944

COMMENT ON CURRENT TRENDS (CONT'D)

Service Command had the lowest morbidity from all causes (509 per thousand) and from disease (452 per thousand). Except for the above mentioned Service Commands and the Second Service Command, all other Service Commands reported admission rates from all causes falling within the range of 525 to 565 per thousand.

Respiratory Causes:

The majority of the Service Commands reported lower morbidity from colds, influenza, etc.; the only increases were registered in the Fourth and Fifth Service Commands but these were only fractional. Decreases of 20 percent or more occurred in the First Service Command and the Military District of Washington. The only Service Command reporting a rate in excess of 100 per thousand was the Seventh Service Command (103 per thousand) while the First and Fourth Service Commands reported the lowest rates (about 65 per thousand). The Sixth Service Command continued to report the highest morbidity from pneumonia with a rate of 18 per thousand or double that for the country as a whole.

Common Communicable Diseases:

Morbidity from venereal diseases (excluding EPTS cases) was highest in the First and Fifth Service Commands, both of which reported rates of about 45 per thousand. Relatively high morbidity from diarrhea and dysentery was experienced in the Fourth, Eighth, and Ninth Service Commands all of which had rates of about 15 per thousand. New cases of measles declined sharply in the Fourth, Fifth, Seventh and Eighth Service Commands. A large proportion of the decrease in the number of new cases of mumps was accounted for by markedly fewer cases in the Eighth, Third, and Fifth Service Commands. The decline in the number of new cases of scarlet fever was accounted for principally by the Ninth Service Command. The Fourth and Eighth Service Commands, with about 20 cases each, accounted for almost two thirds of the total new cases of meningitis in the entire country. More than half of the new cases of rheumatic fever were concentrated in the Seventh and Ninth Service Commands.

NON-EFFECTIVE RATE:

The non-effective rate decreased slightly to a figure of 35.9 per thousand or close to the lowest rate reached this year (35.6 per thousand for the week ending 5 May).

STATIONS WITH HIGHEST MORBIDITY:

As in previous weeks, the station reporting the highest morbidity from disease excluding venereal EPTI cases was the AAF Redistribution Center, N. J. which showed a rate of about 1300 per thousand for the current week; this high morbidity is caused largely by neuropsychiatric admissions. The station reporting the highest admission rate for colds, influenza, etc. was Camp Abbott, Oreg. with a rate of about 380 per thousand. High admission rates from injury continued to be reported by the W. Va. Maneuver Area and the Miss. Ordnance Plant.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 9 JUNE 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week remained at 35 per thousand strength. The number of neuropsychiatric cases remaining as of 9 June 1944 was reported at 15,966 or about the same as for the previous week. The number of malaria cases under treatment has increased steadily in recent weeks from a low of 1,748 on 14 April to 2,153 on 9 June 1944; only 38 of these cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,137 as of 9 June 1944.

The number of battle casualty patients remaining as of 9 June was 6,469 which is the highest figure reported so far.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 9 June 1944 was reported at about 367,400 or about the same as at the end of the previous week. The number of beds occupied was 138,500 or 1,600 less than for the previous week, while the number of "available vacant" beds increased to 153,400. Total beds occupied represented 38 percent of total bed capacity. There were 6 stations with bed capacity of about 6,000 having no "available vacant" beds; one General Hospital with a bed capacity of about 3,000 included among them.

The number of normal beds remained at about 280,000 or 76 percent of the total bed capacity. Included in the normal bed capacity were 410 T/O hospital beds and tentage, while the total bed capacity included 470 such beds, of which 42 were occupied.

The total bed capacity of General Hospitals was again reported at about 109,000 (the highest figure so far attained); about 48,000 of these beds (or 44 percent) were occupied. The "available vacant" beds at General Hospitals numbered 40,000. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of T/O hospital beds and tentage mentioned above) continued at about the 259,000 beds reported since 5 May 1944. Normal beds in these hospitals remained at about 175,000. Total beds occupied as of 9 June 1944 numbered 91,000 (or 35 percent of the corresponding total bed capacity) which is the lowest level reported during 1943 and 1944 to date. Station Hospitals had 116,000 "available vacant" beds as of 9 June 1944.

As of 9 June 1944 the bed capacity of convalescent facilities in General Hospitals numbered 14,572 beds of which 4,403 beds (or 30 percent) were occupied.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 28 APRIL 1944

VENEREAL DISEASE ADMISSION RATES

This Supplementary Health Report presents a study of the venereal disease admission rates by color for all units in the continental United States reporting on Form 86ab. The data cover the four week period ending 28 April 1944 and are presented for individual stations only where the mean colored male strength was 1000 or over, with the data for all other units being grouped together within each Service Command.

In considering venereal disease morbidity during April reference should be made to the Supplementary Health Report contained in Weekly Health Report for the week ending 19 May 1944 in which venereal disease admission rates are shown for individual stations for all Army personnel combined. On page 38 of that report are set forth the number of cases remaining under treatment in each Service Command at the end of April. The total venereal cases remaining under treatment accounted for 2.6 percent of all types of cases under treatment. The corresponding days lost due to venereal diseases during the four week period ending 28 April 1944 totaled 115,000, representing a non-effective rate of .95 per thousand.

For total Army personnel morbidity from venereal disease, excluding EPTS cases was at a rate of 29 per thousand in April or about the same as during March. For colored males the corresponding rate was 141 per thousand, while for "all other" Army personnel the rate was only 19 per thousand, both rates being about the same as in March. Thus, morbidity of colored from venereal diseases has recently been 7 times as high as for other Army personnel.

Considering the specific venereal diagnoses (excluding EPTS cases), the syphilis rate for colored males was about 15 times as high as for other Army personnel, but for gonorrhea the colored male experience was only about 6 times as high. Venereal diseases other than gonorrhea and syphilis were practically all found among the colored males who accounted for about 85 percent of such cases, although comprising less than 10 percent of the total strength of the Army. The admission rate from such venereal diseases was about 14 per thousand for colored males as contrasted with only .2 per thousand for the remainder of the Army.

Morbidity from venereal EPTS cases (predominately syphilis) was reported at 26 per thousand for the total Army, with corresponding rates of 225 and 8 per thousand for colored males and the remainder of the Army respectively. Variation in the admission rate for venereal EPTS cases reflects entirely the experience among the current inductees, so that variations by Service Command and individual station have little significance. Quite naturally induction centers have very high rates, whereas other stations show few cases or none at all.

As in the previous month, the Second Service Command reported the highest morbidity from venereal disease, excluding EPTS cases, for colored males; this rate of 204 per thousand was almost 50 percent higher than the colored male rate for the country as a whole. The very high morbidity at Camp Kilmer and Camp Shanks, which include large numbers of task force troops not

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 28 APRIL 1944

VENEREAL DISEASE ADMISSION RATES (CONT'D)

under the jurisdiction of the Second Service Command, was in the main responsible for the high admission rate of the Second Service Command. The Fifth Service Command showed the next highest morbidity for colored troops with a rate of 170 per thousand, while the Third Service Command and The Military District of Washington with rates of 116 and 76 per thousand respectively, were the lowest.

There was relatively little variation by Service Command in the morbidity from venereal disease, excluding EPTS cases, for the remainder of the Army. Practically all Service Commands had rates within the range of 19 to 21 per thousand strength. The Military District of Washington, however, reported morbidity from this cause of only 9 per thousand, while the Fifth Service Command showed a rate of 27 per thousand.

Admission rates for colored males from venereal diseases, excluding EPTS cases, in excess of 300 per thousand were reported by the following stations in respect to their colored male strength: Camp Kilmer, N. J., Jefferson Barracks, Mo., Camp Polk, La., Camp Swift, Texas and Camp Stoneman, Calif. The highest rates of admission for syphilis excluding EPTS cases for colored males were reported for Camp Polk, La. (162 per thousand), San Antonio, Texas Aviation Cadet Center (127 per thousand), Camp Stoneman, Calif. (124 per thousand), Jefferson Barracks, Mo. (113 per thousand), and Camp Gordon, Ga. (111 per thousand). The highest rates for colored males from other venereal diseases excluding EPTS cases were reported at Camp Kilmer, N. J. (116 per thousand), Fort Lawton, Wash. (86 per thousand), and Camp Polk, La. (81 per thousand).
